

20 μ A, 1/8-Unit-Load, Slew-Rate-Limited RS-485 Transceivers

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{CC})7V
 Control Input Voltages (\overline{RE} , \overline{DE})-0.5V to ($V_{CC} + 0.5$ V)
 Driver Input Voltage (DI)-0.5V to ($V_{CC} + 0.5$ V)
 Driver Output Voltages-7.5V to 12.5V
 Receiver Input Voltages (A, B)-7.5V to 12.5V
 Receiver Output Voltage (RO)-0.5V to ($V_{CC} + 0.5$ V)
 Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
 8-Pin Plastic DIP (derate 9.09mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)727mW
 14-Pin Plastic DIP (derate 10.00mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) .800mW

8-Pin SO (derate 5.88mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)471mW
 14-Pin SO (derate 8.33mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)667mW
 8-Pin μ MAX (derate 4.10mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$)330mW
 Operating Temperature Ranges
 MAX148_C_ 0°C to $+70^\circ\text{C}$
 MAX148_E_ -40°C to $+85^\circ\text{C}$
 Storage Temperature Range -65°C to $+160^\circ\text{C}$
 Lead Temperature (soldering, 10sec) $+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

($V_{CC} = 5\text{V} \pm 5\%$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.) (Note 1)

Pin Description

PIN			NAME	FUNCTION
MAX1482	MAX1483			
DIP/SO	DIP/SO	μMAX		
2	1	3	RO	Receiver Output. With the receiver output enabled (RE low), RO is high if A > B by 200mV or when A and B are not connected, and RO is low if A < B by 200mV.
3	2	4	RE	Receiver Output Enable. When RE is low, RO is enabled. When RE is high, RO is high impedance. If RE is high and DE is low, the MAX1482/MAX1483 enter a low-power (0.1μA) shutdown state.
4	3	5	DE	Driver Output Enable. The driver outputs, A and B, (Y and Z for the MAX1482) are enabled by bringing DE high. When DE is low, the driver outputs are high impedance, and the devices can function as line receivers if RE is low. If RE is high and DE is low, the parts will enter a low-power (0.1μA) shutdown state. If the driver outputs are enabled, the devices function as line drivers.
5	4	6	DI	Driver Input. With DE high, a low on DI forces output Y low and output Z high, and a high on DI forces output Y high and output Z low.
6, 7	5	7	GND	Ground
9	—	—	Y	Noninverting Driver Output
10	—	—	Z	Inverting Driver Output
—	6	8	A	Noninverting Receiver Input and Noninverting Driver Output
12	—	—	A	Noninverting Receiver Input
—	7	1	B	Inverting Receiver Input and Inverting Driver Output
11	—	—	B	Inverting Receiver Input
14	8	2	VCC	Positive Supply: 4.75V to 5.25V
1, 8, 13	—	—	N.C.	No Connect—not internally connected

Applications Information

The MAX1482/MAX1483 are low-power transceivers for RS-485 and RS-422 communications. The MAX1482 and MAX1483 are specified for data rates of at least 250kbps. The MAX1482 is a full-duplex transceiver while the MAX1483 is half duplex. When disabled, the driver and receiver outputs are high impedance.

The 96kΩ, 1/8-unit-load receiver input impedance of the MAX1482/MAX1483 allows up to 256 transceivers on a bus, compared to the 1-unit load (12kΩ input impedance) of standard RS-485 drivers (32 transceivers maximum). Any combination of MAX1482/MAX1483 and other RS-485 transceivers with a total of 32 unit loads or less can be put on the bus.

Reduced EMI and Reflections

The MAX1482/MAX1483 are slew-rate limited, minimizing EMI and reducing reflections caused by improperly terminated cables. Figure 9 shows both the driver output waveform of a MAX1482/MAX1483 transmitting a 125kHz signal and the Fourier analysis of that signal.

High-frequency harmonics have much lower amplitudes, and the potential for EMI is significantly reduced.

20 μ A, 1/8-Unit-Load, Slew-Rate-Limited RS-485 Transceivers

Figure 11. Receiver t_{PHL}

Figure 12. Receiver t_{PLH}

Low-Power Shutdown Mode

A low-power shutdown mode is initiated by bringing RE high and DE low. The devices will not shut down unless **both** the driver and receiver are disabled. In shutdown, the devices typically draw only 0.1 μ A of supply current.

RE and DE may be driven simultaneously; the parts are guaranteed not to enter shutdown if RE is high and DE is low for less than 50ns. If the inputs are in this state for at least 600ns, the parts are guaranteed to enter shutdown.

For the receiver, the t_{ZH} and t_{ZL} enable times assume the part was not in the low-power shutdown state. The $t_{ZH}(SHDN)$ and $t_{ZL}(SHDN)$ enable times assume the parts were shut down (see *Electrical Characteristics*).

It takes the receivers longer to become enabled from the low-power shutdown state ($t_{ZH}(SHDN)$, $t_{ZL}(SHDN)$) than from the operating mode (t_{ZH} , t_{ZL}). (The parts are in operating mode if the RE, DE inputs equal a logical 0, 1 or 1, 1 or 0, 0.)

Driver Output Protection

Excessive output current and power dissipation caused by faults or by bus contention are prevented by two mechanisms. A foldback current limit on the output stage provides immediate protection against short circuits over the whole common-mode voltage range (see *Typical Operating Characteristics*). In addition, a thermal shutdown circuit forces the driver outputs into a high-impedance state if the die temperature rises excessively.

Propagation Delay

Digital encoding schemes depend on the driver and receiver skew. Skew is defined as the difference between the rising and falling propagation delay times. Typical propagation delays are shown in Figures 11 and 12 using Figure 10's test circuit.

The difference in receiver delay times, $|t_{PLH} - t_{PHL}|$, is typically under 160ns.

The driver skew times are typically 160ns (800ns max).

20 μ A, 1/8-Unit-Load, Slew-Rate-Limited RS-485 Transceivers

Figure 13. System Differential Voltage at 250kbps (125kHz) Driving 4000 Feet of Cable

Line Length vs. Data Rate

The RS-485/RS-422 standard covers line lengths up to 4000 feet. For line lengths greater than 4000 feet, see Figure 16.

Figure 13 shows the system differential voltage for the parts driving 4000 feet of 26AWG twisted-pair wire at 110kHz into 120 Ω loads. Even after 4000 feet of cable, the MAX1482/MAX1483 output shows virtually no distortion.

Typical Applications

The MAX1482/MAX1483 transceivers are designed for bidirectional data communications on multipoint bus transmission lines. Figures 14 and 15 show typical network applications circuits. These parts can also be used as line repeaters, with cable lengths longer than 4000 feet, as shown in Figure 16.

To minimize reflections, the line should be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible (although the slew-rate-limited MAX1482 and MAX1483 are more tolerant of imperfect termination than standard RS-485 ICs).

Isolated RS-485

For isolated RS-485 applications, see the MAX253 and MAX1480 data sheets.
